

## HOW THE UNIT WORKS:

Water is the medium common to all life forms in our planet. The energy of water can be beneficially altered. Since our bodies are 80% water, they easily interact with other bodies of water, especially in this energy healing process known as Ion Cleanse.

The body's basic signature frequency is a unique pattern of many frequencies, which, like fingerprints, remains constant throughout life. Using water, the Ion Cleanse/energy healing technology picks up this basic signature emanating from the body, and feeds it back. This process is referred to as "hypercharging."

The body utilizes energy to carry on life-sustaining functions. The foremost priority is almost always detoxification. A toxin is that substance that the body cannot integrate into itself. Toxins are unique in that they must be stored if they cannot be excreted.

Over time, the storage areas become diseased: arthritis in the joints, stones in the liver, kidneys and gallbladder, arteriosclerosis in the arteries, clogged arteries that cause heart disease and stroke, heavy metals in the brain and nervous system, and a host of diseases too numerous to mention. With cellular energizing and cleansing provided by the Ion Cleanse treatment, the goal is to facilitate the body in eliminating toxins.

## WHAT IS IN THE WATER AFTER AN ION CLEANSE TREATMENT?

Laboratory tests have shown increases in some of the heavy metals to include aluminum, copper and zinc. In a particular study in Colorado a patient was known to be copper toxic and the result was indicated that the Ion Cleanse treatment was indeed stimulating release of copper ions into the water.

In urine tests, quantum increases in the excretion of several heavy metals through the urine was found after five treatments.

Heavy metal excretion in urine was tested before, after one treatment and after five treatments, the results were staggering. Aluminum, which did not show in the before sample, jumped to 23 ppb (parts per billion) after the first treatment, and 110 ppb after the fifth treatment. Arsenic, cadmium and nickel showed lesser increase over five treatments, revealing that the heavy metals were being excreted from the body progressively.

An interesting but mild "side effect" will be experienced by a few patients who seem to go through "cleansing reactions." Patients with fibromyalgia, chemical and heavy metal toxicity are most likely to feel discomfort as the Ion Cleanse greatly accelerates the release of toxins.

The necessity of supplementing with microminerals and Choline to speed and support the transport of heavy metals and chemicals out of the body, are indicated in such cases. Additionally, other nutraceuticals, including vitamins, minerals, homeopathic remedies, etc., may be indicated to facilitate or enhance detoxification of a patient on a specific case-by-case basis.

**Any metal that is not utilized or excreted from the body becomes toxic.** Unused calcium, for instance, clogs arteries, which eventually causes arteriosclerosis. Ion Cleanse treatments accelerate change and speed up the removal of heavy metals. These transactions require supplements that are easily assimilated. First, to prevent the transiting heavy metals from returning to their old receptor sites, and secondly, to facilitate the increase in metabolic activity (anabolic) stimulated by the Ion Cleanse.

By precipitating out (detoxifying) heavy metals such as inorganic salts of calcium, organic calcium may more readily work. One clinician reported that after 60 Ion Cleanse treatments, his bone mineral density increased from 0.9 (osteopenia/osteoporosis) to 1.24 within three months of starting with the Ion Cleanse treatments. The same practitioner reported circulation to the hands and feet improved dramatically; and "I am free of joint pain and my body fat content is down."

## ENERGY HEALING – ION CLEANSE

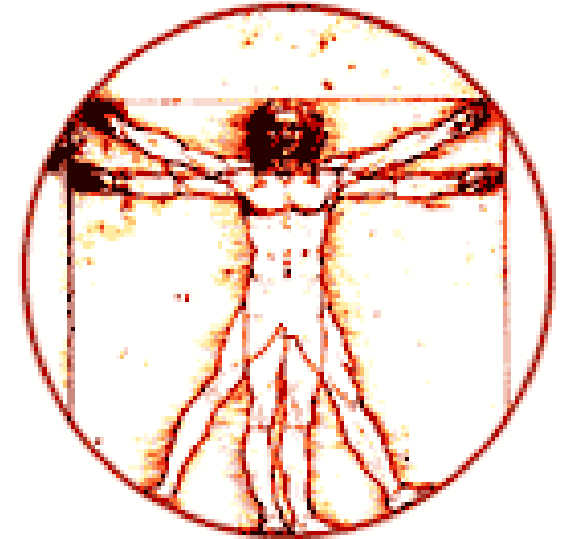

Other interesting effects of the Ion Cleanse treatment occurs to cancer patients who have been administered the Ion Cleanse while undergoing chemotherapy. Incidental reports include chemical odors filling the entire office – and an almost complete remission of the side effects from the chemotherapy.

Utilizing the Ion Cleanse to help detoxify a patient with cancer should be viewed as a complimentary procedure, not an alternative procedure. While cancer patients can be treated with the Ion Cleanse unit, we are not treating the cancer, nor attempting to offer a cure for the cancer. Simply, Ion Cleanse will facilitate detoxification so that the body's own systems will be enhanced.

Various practitioners have reported that, as they have gained experience with the Ion Cleanse unit, they come to know that it has a profound healing effect on their patients, but they cannot adequately explain why it increases such beneficial changes. Clear tap water will change to a multitude of colors, including orange, dark green, brown, black, along with other particles circulating in the water. However, no one has been able to scientifically identify this particular matter, aside from

the heavy metals, which are easily discerned. It is surmised that the tap water pH falls between 5.5 and 6.0 and rises to 7.2 to 7.4 after the Ion Cleanse.

Based on these phenomenon, we can speculate that since the water in the tub and the water in the body vibrate at the same frequency, the water in the body alkalizes and the toxins in the body separate out. Before and after pH readings confirm this alkalizing effect occurring in the body fluids. We also know from oximeter readings that blood oxygenation increases after the Ion Cleanse treatment. These are easily verifiable phenomenon – beneficial change in fluid pH and the increase in blood oxygen – greatly enhance the body's ability to heal itself. Therefore, the main function of the Ion Cleanse is to increase the amount of energy available to the body to mobilize toxins.
